

RAIN SENSORS

Consider acquiring a rain sensor. These devices, installed on your irrigation system controller, will gather rainfall and if the quantity is sufficient, will prevent your irrigation system from running and wasting water. Some operate by remote control using batteries and eliminate the need for hard wiring. When the sensors dry out, it will allow the system to resume normal operation. These sensors are especially useful during vacation or extended stays away from home. These devices are easily acquired from local landscapers and irrigation installers and are reasonable in cost.
